

# HIGH PERFORMANCE FILTRATION SYSTEM

### Ultra Fine filter

The 0.01~0.001 super-minute porous structured filter system has a selective filtering function: lets minerals pass but easily eliminates viruses, bacteria and various microorganisms.

### Silver Coated Active Carbon

The filter contains silver coated active carbon. The carbon is obtained from palm trees that are burnt to create charcoal. The silver serves an antibacterial function to keep bacteria from growing in the filter and the carbon removes unwanted smells and flavors, leaving only good tasting water.

### Special Filter (textile)

This filter contains a triple textile filter, so no need to worry about germ propagation.

### Tourmaline Ceramic

Thanks to the tourmaline in the ceramic, this material generates an electrical current of 0.03mA which contributes to functions such as absorption and anion formation which help to activate tap water for ionization

### Calcium

A necessary nutrient that is used to remove unwanted odors and flavors in water.

### Calcium Addition Function

The addition of expanded and granulated calcium to the water ionizer via a special mineral port helps to enhance the ionizing capacity of the machine.
